The modern cloud application stack

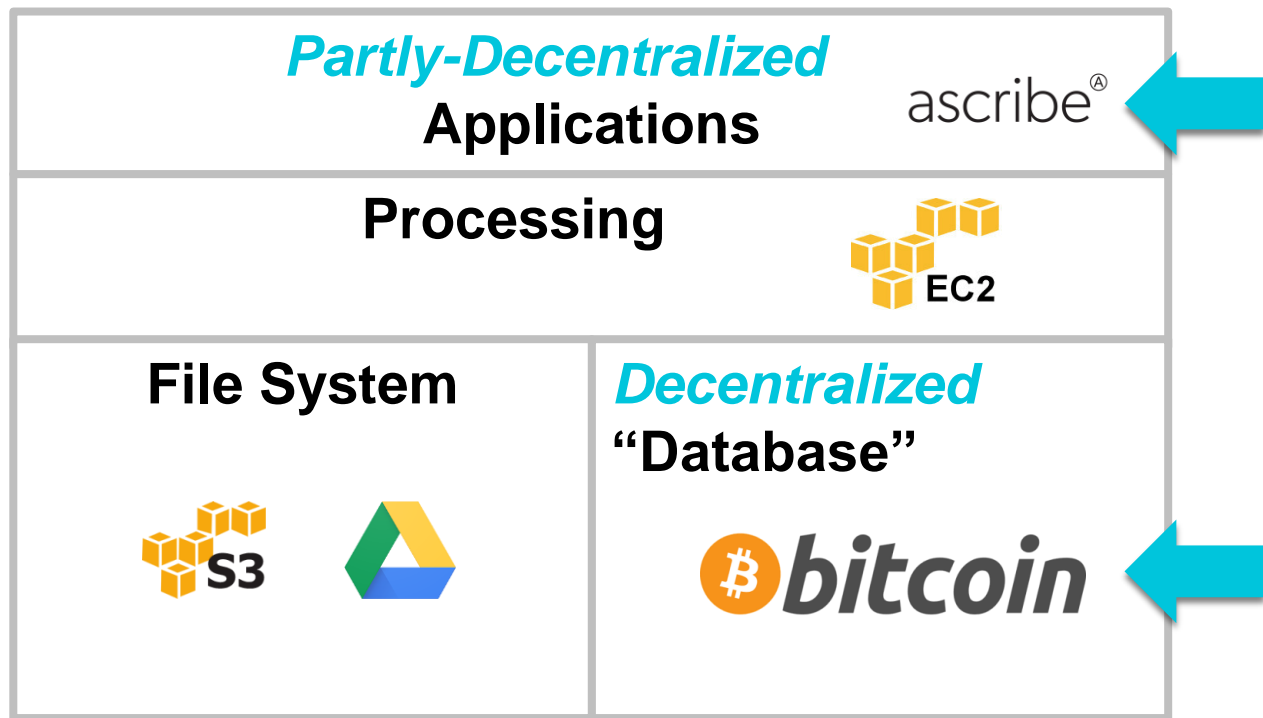

Along came Bitcoin...

“Magic Internet Money”

Bitcoin sparked a revolution

Truly own digital assets, supply chain visibility,

1.5 tx/s
50GB

What about **planetary** scale?

Planetary scale:
Netflix uses 37% of
Internet bandwidth

“Big data” Distributed DBs

Writes / s vs. # nodes

Planetary scale:
Netflix uses 37% of
Internet bandwidth

To be Distributed, Big Data DBs Must Solve Consensus

Byzantine Consensus
(1982)

Paxos (1990/1998)

Two ways to scale up

Big data-fy the blockchain

- Builds on man-decades of work
- Significant scalability hurdles?

<or>

Blockchain-ify big data

- Builds on man-centuries (millennia?) of work
- Scalability challenges already resolved
- Needs decentralized control, immutability, ..

“Blockchain-ify”

Decentralization: no single entity owns or controls

Immutability: tamper-resistant

Assets: Can issue & transfer assets

Blockchain (noun): hashed-together chain of blocks (1991!)

Blockchain (noun): storage that is decentralized + immutable + assets

Blockchain (*adj*): decentralized + immutable + assets

How to Blockchain-ify Big Data

Retain Big Data DB's Performance

- Let the Paxos derivative *solve order*. Get out of its way!
- It naturally builds a log of *all* txs

Add in blockchain characteristics

- **Decentralization:** federation voting on txs. Group into blocks for speed.
- **Immutability:** hash on prev. blocks
- **Assets:** Digital signatures etc.
